- [Sun99] Sun Microsystems. Lxrun free software: Run Linux binaries unmodified on Solaris. World-Wide Web document, 1999. URL <http://soldc.sun.com/articles/lxrun/>; <http://sun.com/linux/lxrun/>; <http://sun.com/software/linux/lxrun/download.html>; <http://www.sunfreeware.com>; <http://www.ugcs.caltech.edu/~steven/lxrun/>. “Lxrun is a freely downloadable utility that executes Linux applications on the Solaris 7 operating environment on Intel platforms. Lxrun is a software layer that sits between Solaris and the Linux Intel binary executable and remaps system calls ‘on the fly’ allowing them to run unmodified on Solaris.”
- “Lxrun is an emulator for executing Intel Linux a.out and ELF binaries on other types of UNIX running on Intel x86. It was developed originally on and for SCO OpenServer and SCO UnixWare.

- Lxrun does system call remapping ‘on the fly.’ There isn’t a significant difference between the execution environment required by Linux and SCO binaries. The primary difference is the way in which system calls are handled.
- [Sut02] Ed Sutter. *Embedded systems firmware demystified*. CMP Books, 6600 Silacci Way, Gilroy, CA 95020, USA, 2002. ISBN 1-57820-099-7. xii + 364 pp. LCCN TK7895.E42 S875 2002. Includes CD-ROM.
- In Linux, an int 0x80 instruction is used, which jumps to the system-call-handling portion of the Linux kernel. On SCO systems, int 0x80 causes a SIGSEGV signal. Lxrun intercepts these signals and calls the SCO equivalent of the system call that the Linux program attempted.

URL <http://www.research.ibm.com/journal/rd/483/stetter.html>; <http://www.research.ibm.com/journal/rd/483/stetter.pdf>.
- There is also some mapping of ioctls, various flags, return values, and error codes. The result is that the Linux binary runs—with the help of lxrun—on the host platform with a small (usually negligible) performance penalty.”
